Consolidation and Review Activities
Homework
SMSC/ ICT/ Cross Curricular Connections

This symbol indicates that there are aspects of this curriculum area that pupils have previously practised. Pupils will be revisiting earlier content as part of their consolidation or in order to ensure knowledge is secure before expanding into new learning. References to these earlier SOL are noted for teachers to check specific objectives and content. For KS2 identification, please refer to the KS3 SOW and National Curriculum linked document in the shared area.

Term 1							
	Topic 1: Unit 1 - N	lumber (Approxir	nately 4 weeks)			-	
N2 N3 N4 N6	How do you calculate accurately with positive and negative numbers? KS2, Yr7 Ch2	<ol> <li>1.a Calculations</li> <li>1.b Divisibility and division</li> </ol>	Use written methods to add and subtract more than two numbers (including decimals). Multiply with accuracy. Use mental calculation for multiplication. Estimate answers to calculations. Understand, choose and use a range of strategies for mental calculations by developing an understanding of relationships between numbers. Know and use divisibility rules. Use a written method to divide decimal numbers by integers. Understand the relationships between divisibility rules and relate to factors and multiples.	Add, subtract, multiply, divide, sum, product, total, negative, integer, calculation, square, indices, powers, roots, prime, factor, multiple, LCM, HCF, See command words	Starter quizzes for the term should include: Focused accuracy drills including timetables Required prior knowledge Mixed skills practice Knowledge gap support Look, cover, write, check. Pupils are expected to complete purposeful exercises and repeated practice on:	<ul> <li>Pearson's Pi2 Ex1</li> <li>Pearson's Theta2 Ex1</li> <li>Person's Delta2 Ex1</li> <li>Support/Core/Extend KS3 book Year 8 Ch1</li> <li>Cambridge Essentials 7 support/core NCh3&amp;4</li> <li>KS3 Consistency document</li> <li>Key &amp; exemplar questions – WRM - Add and Subtract</li> <li>WRM - Multiply and divide</li> <li>WRM - Multiples &amp; factors</li> <li>WRM - Directed numbers</li> </ul>	By maintaining high standards of behaviour, including mutual respect and tolerance for different ideas to their own, class teachers will be promoting British values. Throughout the year, students should be encouraged to actively listen to understand the viewpoint of others when learning involves opinions, interpretation of fact and alternative methods Gatsby Benchmarks:
		1.c Calculating with negative integers	Add, subtract, multiply and divide positive and negative numbers, including larger numbers and decimals. Extend the 'rules' for calculations with negative numbers to very large numbers and decimal numbers. Distinguish between the negative sign and subtract operation.		<ul> <li>4 operations - integers,</li> <li>4 operations - decimals</li> <li>4 operations - negatives.</li> </ul>	Number skills - textbook generator <u>Question</u> <u>Generators - MathsBot.com</u> Printed directed number lines.	Careers & Personal Finance Use real-life contexts with basic integer and decimal calculations wherever possible in KS3 to help
	What other types of numbers can I calculate with? KS2, Yr7 Ch2	<ol> <li>1.d Powers and roots</li> <li>1.e Multiples and factors</li> </ol>	Calculate using squares, square roots, cubes and cube roots. Give integers that a square root lies between. Relate knowledge of negatives to negative square roots and give two answers for square roots. Calculate combinations of squares, square roots, cubes, cube roots and brackets with the order of operations. Use a calculator to check answers. Understand how to write complex calculations with full correct notation. Use index notation. Write a number as a product of its prime factors.		<ul> <li>Recall of square and cube numbers</li> <li>The order of operations</li> <li>Prime factor decomposition</li> <li>HCF and LCM</li> <li>Aim for proficiency and ensure written work is of a high quality.</li> <li>Practical problems involving operations in</li> </ul>	Manipulatives for directed number support: <u>Number Line</u> (mathsbot.com) Directed numbers drills - <u>Directed Number</u> <u>Patterns (mathsbot.com)</u> Manipulatives for prime number representations and multiplication <u>Prime</u> <u>Factor Tiles (mathsbot.com)</u>	students to engage and relate learning to everyday and working life. <u>Maths, Why Bother?</u>   <u>MYPATH Careers Resources</u> ( <u>mypathcareersuk.com</u> ) Discuss the relevance of Maths skills to develop confidence in monetary calculations and why this is important. This does not need to be a separate defined topic, but should be incorporated within

## Use of Big Questions and Lesson Questions

Please refer to the department document on using Big Questions as part of The Abbey Lesson – "What does an Abbey Lesson look like in Maths?".

Big Questions are designed to build upon pupils' prior knowledge and link topics across KS2, 3 and 4. Big Questions will connect a series of learning outcomes, as opposed to focussing on individual objectives. All students, regardless of ability will be exposed to the same knowledge within reason, but able to explore Mathematical concepts to varying depths and wider applications. The spectrum of the Big Question focus allows for this to happen. This is where Lesson Questions are used to tailor the approach, level of detail and depth of knowledge to suit the ability, attainment, and confidence of individual classes.

### Common Misconceptions Notes

#### Unit 1

Place value errors, such as not aligning columns correctly when adding or subtracting. Check that students know to align columns from the right for whole numbers, and that they set their working out clearly Not using correct order of operations. Emphasise that any calculations in brackets must be evaluated first.

0. 16  $\div$  2 = 0.8 (use long division to demonstrate keeping the decimal point/place value).

Students think that -2 always means subtract 2. Use the number line to demonstrate the two uses of the - sign. -2 is the name of a number on the number line. To subtract 2 from 5, write 5 - 2. To subtract 2 from -2 write -2 - 2. To multiply 3 by -2 write  $3 \times -2$  or  $3 \times (-2)$  to make it absolutely clear that there is no subtraction.

Students misuse rules such as "two negatives make a positive", e.g. -3 - 7 = 21 Explain that the rule only works when multiplying, dividing and for two adjacent + or – signs. There is no × sign in the calculation -3 - 7 so the rule cannot be used. Calculate -3 - 7 using the number line.

Students think that the square root of a number is half of the number and cube root is a third of the number. Use a function machine diagram to demonstrate squares, square roots, cubes and cube roots. Students may not completely decompose a number into its prime factors. Refer the student to a list of prime numbers.

Students may count too many or too few prime factors of a decomposition when finding the LCM, or simply multiply the two numbers together to find the LCM. Show that the decomposed LCM of 12 and 18 (36 = 2 × 2 × 3 × 3) contains the primes of each decomposed number (12 = 2 × 2 × 3 × 3) and no more than primes than are necessary. Demonstrate that simply multiplying the two numbers together gives a number bigger than the LCM. Writing the square of a negative number as negative. Encourage students to write the square out in full and apply the rules for multiplying negative numbers

#### Unit 2

Forgetting to use the ½ in the formula for the area of a triangle. Resolve pictorially by drawing in the rectangle that contains the triangle to show that the area of the rectangle needs to be halved to find the area of the triangle. When calculating the area of a parallelogram, using the slant height instead of the perpendicular height.

Finding volume instead of surface area. Resolve by reminding students to read the question carefully. If they're asked to find area, they need to think of the net of the box, as it's the area of cardboard that is needed. If they're asked to find the volume it's the space that the shape takes up.

Not finding the area of all 6 faces. Resolve by making a sketch of the net of the cube/cuboid and writing the area of each face on the net so that none are forgotten. Confusion of vocabulary for faces, edges and vertices. Students can remember that Faces are Flat, or that the V of Vertices has a vertex at the bottom. Students often orient isometric paper incorrectly. Check the distance between vertically aligned dots is shorter than the distance between horizontally aligned dots. When 'counting cubes' to find the volume of a cuboid or shape made from cubes, students often omit any 'hidden' cubes. Encourage students to visualise the full shape. Units used in the answer must match units given in question. Students also sometimes incorrectly use length or area units rather than volume units. Pupils multiply by 10, 100, 1000 instead of dividing. Encourage students to use common sense to check calculations. Forgetting to calculate the cross-sectional area correctly, e.g. forgetting to divide by 2 for a triangle or not being able to calculate the area of a trapezium. Confusing the formula for the area of a circle with the formula for the circumference of a circle.

Applying Pythagoras' theorem to triangles that are not right-angled.

#### Unit 3

Students may have difficulties finding the size of equal class intervals. Encourage them to identify the minimum and maximum values that would lie in a class interval to find the size.

Not recognising the modal class as being the most frequent group for grouped data.

Joining bars for discrete data.

Lack of understanding that a pie chart represents proportions rather than actual numbers.

Drawing all angles from first radius, rather than from edge of previous sector. Encourage students to label each sector with what it shows, as they complete it, to help reinforce that the sector is now finished and they should start a new one for the next data item. Just as when eating pizza, you don't go back to a 'slice' once you have finished it.

Calculating the mean – dividing by the number of rows in the table, not by the total frequency. Pictorial Use bar model e.g. for Q2

Not ordering the leaves. Emphasise that drawing the diagram is a two-step process – Step 1 decide on the stem, write in the leaves as you cross them off the data list, Step 2 copy out neatly, with the leaves in order.

Writing only the 'leaf' as the mode or median. Ask Is your answer sensible? Is it one of the data values? e.g. if the student says the modal parking time is 2 minutes, ask Did anyone park for only 2 minutes?

Not being able to decide which is the most appropriate average to use in an 'open' question. Suggest this strategy: work out all the averages. Decide which is closer to most of the data values.

Thinking the line of best fit has to go through zero. See the discussion after Q6. Emphasise that the line has to go through the middle of the data points and follow the shape of the data distribution.

#### Unit 4

Students may write 5x - 4x = 1x, or 4x - 5x = -1x. Although it is not incorrect, explain to students that it is not necessary to write the 1. The convention is to write 5x - 4x = x, or 4x - 5x = -xCombining unlike terms e.g. 2p + 3r = 5pr. Resolve using a concrete activity such as using pens and rulers to represent p and r. Show that 2p + 3p simplifies to 5p and that 2r + 3r simplifies to 5r, but that 2p + 3r cannot be simplified as you are not adding the same types of items.

Not using the inverse when finding inputs. Encourage students to draw the inverse function machine, and also to check their answer by putting it through the original function machine – do they get the given output?

When expanding brackets, multiplying only the first term by the number outside the bracket, e.g. 4(x + 2) = 4x + 2. Concrete Resolve using an activity such as using a box to represent a bracket.

Students may not realise that p can be written p<sup>1</sup>. Write  $2^3 \div 2^2 = 2^{3-2} = 2^1$  and  $2^3 \div 2^2 = 8 \div 4 = 2$  showing that  $2^1 = 2$ . This works for any number, so it also works for a letter because in mathematics a letter is a number. Write  $a^1 = a$ . Students only change the sign of the first term when multiplying a bracket by a negative quantity. Demonstrate using numbers, e.g.  $-2 \times (5 + 1)$  by expanding and using BIDMAS and then  $-2 \times (5 - 1)$ .

Students only partially factorise an expression. For example, 12a + 16b = 2(6a + 8b) Can you factorise the expression inside the brackets? Write 2(6a + 8b) = 2 × (2 × (3a + 4b)) and simplify. Point out that 4 is the HCF of 12 and 16.

Students divide before adding/subtracting from both sides of a two-step equation. Use function machines to demonstrate the order of working.

When expanding brackets, making errors with the signs. Display the rules for multiplying with negative numbers.

Getting the signs wrong when substituting a negative value. Display the rules for multiplying with negative numbers. Encourage students to write their working out in full

Getting the signs wrong when expanding brackets to solve an equation. Encourage students to write negative numbers in a different colour (or circle them), to help them see the sign as 'part of' the number.

#### Unit 5

Only checking the first difference and assuming the sequence continues in the same way. Assuming a sequence increases linearly.

Accuracy in plotting graphs – uneven intervals or incorrectly marked scales; poor or no labelling. Produce a graph with a number of exaggerated errors for pupils to spot.

Thinking the gradient is found by dividing the change in x by the change in y rather than the other way around. Gradient = change in vertical / change in horizontal so deciding a phrase to aid memory may help:

Thinking that lines parallel to x-axis will be x = c rather than y = c. Practise showing lines such as x = 4, x = -2 y = 10, y = -6 with their arm at the right distance from the origin (x = m, hand and forearm level) (y = m, hand and forearm upright), as this means moving them up and down for the x = and left to right of centre for the y=.

Working out a gradient when the scales are different on each axis. Confusing negative and positive gradients.

Incorrectly substituting into equations involving negatives.

#### Unit 6

When subtracting, writing the wrong number on the top of the calculation.

Forgetting to divide by 10 / 100 after carrying out the calculation.

Assuming 3.09 is larger than 3.4, misunderstanding place value. Not adding zero placeholders to help with calculations. Confusing ascending and descending.

Not correctly lining up the numbers when adding or subtracting.

Students often confuse < and >. Open end points to larger number.

Failure to change both numbers in a decimal division. Encourage students to see this as an equivalent calculation.

Not understanding that ratios can be simplified like fractions.

Failure to understand unit ratios as being a special decimal ratio where one quantity is 1.

Students might need help to solve problems suggested as they are in engineering contexts that may be unfamiliar. Be clear about how you would solve them in advance.

Inability to interpret a unit ratio i.e. reversing the meaning. Students should rehearse saying out loud what the unit ratio means.

#### Unit 7

Students use the wrong scale of a protractor. Demonstrate reading an angle from 0°. Encourage students to check that their reading is reasonable.

Students assume two angles are vertically opposite without using a ruler to check straight lines. Demonstrate using a diagram similar to Q3c.

Students fail to realise that alternate angles can be obtuse. Use a diagram to show that, for every pair of acute alternate angles, there is a pair of obtuse alternate angles (giving a stretched Z).

Students do not use the properties of triangles to help solve a problem. Advise students to identify known triangles when looking at a diagram for the first time. They should look for equal sides and angles, right angles and shape names in the question to identify isosceles, equilateral and right-angled triangles.

Students may assume that a polygon is regular. Emphasise that polygons must be assumed to be irregular unless the question states otherwise or the diagram shows all sides equal or all angles equal (or you can show them to be equal). Students do not give enough reasons for their calculations. Point out that although they may get the correct answer, they may lose marks because they have not presented a reasoned argument.

#### Unit 8

Not simplifying fractions fully. Colour the fractions on squared paper, in blocks of rows and columns, to try to then visualise a simpler fraction

Some students think that you can only simplify by halving, or if you start by halving you have to continue by halving instead of using a different divisor.

Adding or subtracting the denominator as well as the numerator.

Not knowing which denominator to choose. Students should be encouraged to try to find the LCM of the two denominators. Alternatively, using the product of the denominators always works, but the answer will often need simplifying. Not understanding that fractions, decimals and percentage are different ways of recording the same information.

Not making the fractions have equal denominators before calculating.

Not simplifying before / after multiplying fractions.

#### Unit 9

Writing probabilities as numbers less than 0 or greater than 1. Be careful to draw probability scales that do not continue beyond 0 or 1, and reinforce the fact that a probability of 0 represents impossibility and a probability of 1 represents certainty.

Understanding that likely / highly likely and unlikely/highly unlikely have specific mathematical meanings. Differentiate between probabilities of, e.g. rolling a 1 or a 2 on a dice (unlikely), and, e.g. winning the lottery (highly unlikely). Thinking experimental probabilities are exact, or will always be the same if an experiment is repeated.

Making predictions based on a small number of trials. Encourage students to get into the habit of using the number of trials to comment on the reliability of their estimates.

Students do not list all of the outcomes, e.g. miss out identical outcomes. Use the spinner in Q5 to list the 5 possible outcomes: red, red, blue, blue, blue. The spinner has 5 ways to land, so there are 5 possible outcomes, even though they look the same when written.

Students think that estimated probability is less accurate than theoretical probability. Explain that in real life probabilities are best estimated based on past data. Theoretical probability can be used to model real life but will only be an approximation.

Students assume that a dice / spinner is fair without being told it is, e.g. an ordinary dice, a fair spinner. Warn students that they should not assume fairness unless the question says so. Some probability experiments are carried out to see if a spinner or dice is fair.

Students are confused about when to add or multiply probabilities. Remind students that P(A or B) is found by adding the probabilities, e.g. rolling a 2 or a 5 with a dice (+ = ). P(A and B) is found by multiplying probabilities, e.g. flipping Heads with a coin twice (× = ).

Students ignore the fact that two events are dependent. Use a bag of say 3 red and 2 blue coloured counters to demonstrate that the probabilities change when one counter is removed.

#### Unit 10

Converting hours and minutes into decimal numbers of hours, e.g. thinking that 2 hours 40 minutes is the same as 2.4 hours.

Assuming that division always makes things smaller.

Students may not notice that a decimal is recurring if the repeated pattern is very long . Not using dot notation correctly.

Students have difficulty increasing or decreasing by complex percentages, e.g. 3%, 1.5%. Find 1% first, then you can work out any number of percent.

Students do not know whether to multiply or divide by a multiplier. Encourage students to check that their answer makes sense, e.g. a smaller amount after a reduction.

Students think that comparing proportions can answer questions comparing amounts. Clarify using a simple example, e.g. 10% of £20 compared to 5% of £60.

Place value errors in the algebra when changing recurring decimals to fractions.

Confusion over reverse percentages.

## KS3 – Command Words

Please note that this table is not exhaustive but uses the most commonly used command words. These should be highlighted, explained and demonstrated when giving out problem solving work. They will later build into GCSE questions.

Command word	Comments
Write down Write	No working will be needed
Find	Some working will be needed but will be minimal
Work out	Used interchangeably with 'calculate', it will be necessary to do some working out
Calculate	Used interchangeably with 'work out' but use of 'calculate' suggests that a calculator will be needed, it will be necessary to do some workings.
Explain	Explanation needed – may be a sentence or could be a mathematical statement
Give a reason	Clear reasons needed; if geometrical reasons then must link into working
Draw	Implies accuracy is important
Sketch	Less formal than 'draw'(no accurate measurements needed)
Complete	Usually means that some values need filling in, for example, on a probability tree diagram or a table of values
Show	All working needed to get to the required answer must be shown
Prove	More formal than 'show', all steps must be present and, in the case of a geometrical proof, reasons must be given
Prove algebraically	Algebra must be used in the proof
Describe	Words needed to describe, for example, a transformation
Justify	Show all working or give a written explanation
Expand	Remove brackets
Expand and simplify	Remove brackets and simplify
Factorise	Straight forward factorisation
Factorise fully	More complex factorisation, more than one factor to consider
Simplify	Simplify the given expression
Simplify fully	Likely to be more than one stage needed to simplify expression
Solve	Solve an equation / inequality

### **General Resources Bank**

Teachers will select the resources required for individual lessons. These will be fit for purpose for their class in order to promote the best progress and understanding for individual objectives, whilst still working towards the Big Question.

A sample list of resource materials is given as a starting point or for new ideas and are used by the department:

- Pearson's Edexcel KS3 Textbook Series 1 and 2 <u>ActiveLearn (pearsonactivelearn.com)</u>
- Pearson's KS3 Practice homework sheets <u>ActiveLearn (pearsonactivelearn.com)</u>
- MathsBox <u>Mathsbox</u>
  - A wide-ranging selection of mixed quizzes, repeated practice and differentiated questions for use in the classroom, including short term cover work.
- MathsBot MathsBot.com Tools for Maths Teachers
  - o Interactive tools and activites to aid the teaching of mathematics. Hundreds of randomly generated questions and answers and Mathematics Manipulatives for mastery.
- Corbett maths <u>Corbettmaths Videos, worksheets, 5-a-day and much more</u>
  - Video tutorials, questions, revision resources and puzzles.
- Maths 4 Everyone Maths Worksheets [Primary and Secondary] (maths4everyone.com)
  - Carefully thought-out questions that are designed for the different stages of learning a topic. Typically, there is one sheet that focuses on the First Steps, and then other sheets that contain questions which help students to Strengthen and then Extend their understanding.
- Go Teach Maths Go Teach Maths: 1000s of free resources
  - Animated PowerPoint slides to demonstrate a mathematical method within lessons and supporting activities with an individual or paired consolidation focus.
- Oak Academy Oak National Academy (thenational.academy)
  - Online lessons and resources to support independent study particularly useful for students who are having to spend significant amounts of time outside of the classroom.
- Mr Barton Variation Theory Variation Theory
  - A collection of high-quality, sequences of questions and examples using key principles from Variation Theory. Holds questions and examples constant, together with the mathematical behaviour of *reflect, expect, check, explain*.
- Dr Frost Maths DrFrostMaths.com
  - A diverse set of free teaching resources and tools including downloadable teaching slides/worksheets for KS3-5, teaching videos and an online platform for whiteboard practice and exam questions.
- White Rose Secondary KS3 SOL <u>Secondary SOL | White Rose Maths | FREE Maths Teaching Resources</u>
- Additional Maths Blogs and other online resources include:

Solvemymaths	Miss B resources
Resouraholic	Boss Maths
Colleenyoung.wordpress	Nrich
missquinnmaths.wordpress	Pret Homework
Just Maths	BBC Bitesize
Mathed Up	

### Assessments/ Quizzes

Through KS3, pupils are assessed regularly to monitor progress, understanding and make predictions within lessons. Assessment of Learning takes place in the form of:

#### • Formal Graded Assessments

Formal assessments will occur once a term, during week 3 for monitoring purposes and formal feedback. It will be a mixed topic assessment to mimic the mixed topics they will need to answer for their end of year exam. It is to support a more active attitude to revision in small, manageable tasks, as well as allowing students to revisit topics in a formal setting and identify gaps in knowledge.

#### • Topic Quizzes

Other assessment will be end of unit quizzes to assess recent learning and conducted when learning of that sequence is concluded.

For an improved response to revision and independent study, students are expected to undertake guided revision tasks through the year before assessments as part of their homework. Staff will support students with effective techniques and resources offered where required. These revision homework tasks will consist of:

- Directions to important online videos and tasks to consolidate knowledge or expose students to a higher-level task or topic.
- Pre-prepared practice questions on the relevant topics, such as the Active Learn assessment materials and Hegarty Maths.

#### • End of Year Assessments

Dates to follow.

#### Consolidation and Review Activities

As part of each chapter of work, the students will need to undertake consolidation and review activities of their learning before moving on to new topics. This will be done as a Knowledge Recall activity.

This should consist of the following:

a. Revisiting the Big Questions, answered with new knowledge and connections reinforced. The focus here is on questioning of students and consolidation the sequences of lessons from the chapter.

b. Problem solving / literacy based questions with emphasis placed on highlighting key words and data, before undertaking problems as a sequence of steps. This is only if appropriate for the topic and required as additional work to lesson content.

c. Depending out the outcome of the Knowledge Recall, students can be directed on to either the strengthen exercise for any gaps in understanding or the extension activity work.

A topic quiz will then be set to assess understanding.

Starter activities should include topics identified in PIT from earlier assessments, as well as a constant revision of previous topics for assessment for learning.

## Homework

Mathematics homework is designed and set to promote students' understanding and their ability to use mathematics in a variety of situations. Homework should be set once per week and consist of:

- Online homework through Hegarty Maths \*Trial beginning in September 2021.
- Preparation and Revision for assessments and quizzes, with particular reference to the Knowledge Organisers.
- Written homework when the teacher feels it is necessary or beneficial
- Research or Investigative Tasks.

It is expected that KS3 students will undertake a 30- 45 minutes homework per week.

All students are given individual logins to a variety of virtual learning environments, which give them access to video tutorials, practice questions and answers. The main programmes being used are: Hegarty Maths, Active Learn.

For the majority of the time, homework will support in-class learning and reinforce topics that students have studied recently within the classroom.

If students fail to complete homework, staff will follow procedures outlined in the Behaviour Policy.

## SMSC/ ICT/ Cross Curricular Connections

The programme of study is designed to encourage the development of wider problem solving as the mathematical knowledge of the student advances. Students must look for action points and next steps that are not explicit, in order to solve increasingly complex problems. Lessons should :

- Value listening and respecting the viewpoint of others in problem solving.
- Promote the discussion of mathematical understanding and challenge assumption.
- Support students to question information and data that they are presented with.
- Discourage jumping to conclusions.
- Seek opportunities to build self-confidence.
- Include questions chosen based on prior lack of confidence,
- Encourage collaborative learning in the classroom in the form of listening and learning from each other and paired discussion.
- Develop powers of logic, reasoning and explanation.
- Build competence every student is good at something, and students struggle when connections between their strengths are not obvious or of a clear use.
- Allow choices to promote self-determination, and deal with the consequences, however minor. Giving authentic (not false) choices doesn't have to be complex—for example, choices around how to complete a multi-step problem.

Staff will seek out opportunities to encourage these values within individual lessons.

Staff should also seek out opportunities to link learning to other subjects as part of the ongoing cross -curricular cohesion project. This is ongoing but some existing links are referred to in this document as examples (The Abbey Lens). By maintaining high standards of behaviour, including mutual respect and tolerance for different faiths and beliefs and encouraging learners to respect the protected characteristics, class teachers will be promoting British values. Specific examples relating to the British Values are detailed in certain chapters.
